1.Introduction

Purpose of the system

The purpose of the system is to architect a simple Jewellery website named **PURE** and implement it, which later will be used for a web-based search engine.

Scope of the document

Task of developing the document was distributed among the team members. The team divided itself into various worlds present in the requirements Engineering scenario and thus played their part.

The team was responsible for gathering the requirements and represents them in the required format.

The main constraint placed on the process was the time constraint. For every phase of project, a specific deadline was which had to be met by the development team. The team was scheduled to work the given time frame and produce the result.

Intended audience

The expected audience of this document are the consumers willing to buy High value and BIS Hallmark (Bureau of Indian Standards) Jewellery.

Other information from Web sites: Google AND Bing.

2. Team Architecture

The team consists of4 members:

ARSIYAN KHAN
ADITYAM KUMAR
ABHISHEK YADAV
AYUSH KUMAR VERMA

ARSHIYAN KHAN:

- ARSHIYAN Responsible for the development of the user interface. This includes all aspects of interaction between the user and the website. He will decide the 'look' and 'feel' and overall structure of the interface. This includes the colour schemes, menu layout, fonts, location of option boxes and text etc.

Testing of the user interface will be carried out by him. This will entail ensuring that the user the interface has full functionality and meets an acceptable standard as decided by the user. A recognized evaluation checklist will be used for this purpose.

ADITYAM KUMAR:

- ADITYAM is responsible for development of the system, which accepts the input, processes it and produces the output. Also, he will be responsible for interface between the front end and the back end. This comprises the interface between the database (if any) and the user interface.

ABHISHEK YADAV:

Responsible for helping Arshiyan and Adityam in the development of the user interface and. This includes all aspects of interaction between the user and the system. He will decide the 'look' and 'feel' and overall structure of the interface. This includes the color schemes, menu layout, fonts, location of option boxes and text etc.

AYUSH KUMAR VERMA:

Responsible for Directing the Team, assembling and testing complete software, giving presentation and demo of the final project.

Team Members	**Responsibility**	**Role Played**
Adityam Kumar	Design Development Change control Reusability Traceability	Product Manager Project Manager
Abhishek Yadav	Development Time Reliability Maintainability	Supportive coder and designer
Arshiyan Khan	Response Time Reliability User Interface	Potential End User
Ayush Kumar Verma	Explain and give demo to users	Presentation

3. Overall Description

A simple Jewellery Website has to be architected which will allows to access the detailed description of modern and latest jewellery in the market by users from search engines. The project will use HTML, CSS architectural style, and build a JavaScript applet, which will be accessible on any web browser through a web page.

Since Jewelleries are very precious and critical items for delivery hence the website does not include the feature of online shopping but allows consumers to call the employees to their address to have a closer view of the product and related items, we can understand it as we are calling a door-to-door vendor. In website Index shall accept an ordered set of lines, where each line is ordered set of words, and each word is an ordered set of characters. Any line shall be “circularly shifted” by repeatedly removing the first word and appending it at the end of the line. The KWIC system shall output a listing of all circular shifts of all lines in ascending alphabetical order.

Product Function

This section describes the general functionality of the system being developed which will be discussed in detail in the coming sections.

The functionalities to be satisfied by the system can be broadly classified in the following ways:

Accept Input

The user will be able to choose between different types of jewellery by just selecting some options and resolve any form of form of quarry by chatting with employees.

String Processing

The task is to be carried out once the user has selected the require options. All the details regarding the listed products will be clearly mentioned to the viewer. The employees will attend the consumers on the consumers' address. Payment can be done in the presence of employees for complete assurance of consumer and the company.

Output

On website once processing is complete, the output will display the Thankyou page to the user. On the bases of details given by the user the employees will attend the consumers on the consumers address with similar and related items.

Assumptions and Dependencies

Input

The User Select the wanted products.

Processing

An Employee with attend the consumer for demo of the product.

4. Specific Requirements

External Interface Requirements

The interfaces in this section are specified by documenting: The Name and description of each item, source or input, destination or output, ranges, accuracy and tolerances, units of measure, timing, display formats and organization, and data formats.

User Interface

The user interface required to be developed for the system should be plain, minimal and user friendly. The interface between the user and the system will be menu, icon, Pointers keeping in mind that the system is to be run self-dependently. All operations will be of point, click and search in nature with all navigations performed through windows system, specifically buttons and menus:
Buttons: The button is activated when the user will click with the left click of the mouse within the bounds of the button. And thus, the action associated with it will be carried out.

Menu: All the operations will be arranged in the most useful order.

Hardware Interface

- PC with 300 PC with 300 megahertz or higher processor clock speed recommended; 233 MHz minimum required

(single or dual processor system);* Intel Pentium/Celeron family, or AMD K6/Athlon/Duron family, or compatible processor recommended
- 128 megabytes (MB) of RAM or higher recommended (64 MB minimum supported; may limit performance and some features)
- 200 megabytes (MB) of available hard disk space
- Super VGA (800 x 600) or higher-resolution video adapter and monitor
- Keyboard and Microsoft Mouse or compatible pointing device

Software Interface

- The software will be developed on HTML, CSS and JavaScript.
- It will mainly support windows 8,10 and 11.
- The software will be compatible with maximum possible web browsers.
- The software should be completely self-dependent.

Performance Requirements

The system will process incoming data and send relevant feedback within a few milliseconds of receiving it.
The site will lag or glitch some time if high number of consumers will access it same time.
The system will also be capable of dealing with large consumer groups and large order demand.

5. Non-functional Requirements

Performance Criteria:

Time: The elapsed time between the submission of a search request and the processing of string and displaying the desired output should be as minimal as possible. Similarly, there is be a minimal gap between the finalising of details and sending to company.

User Friendly:

System should be easy to use by experts as well as non-experts. The user interface should be kept simple and uncluttered.

Flexibility:

It should be modular so that later requirement changes can be accommodated.

Portable:

The system should be portable on any platform and should not be bound to run on system having JavaScript.

Reusable:

The system will be modular, so those modules can be reused if the system requirements changes or if these modules are to be used in some other similar system

6. Software System Attributes

Reliability:

The VRS system will be released after thoroughly tested. Situations in which a request and response run unexpectedly shall be very minimal. It will be written in a modular structure to make modification as easy as possible.

Availability:

The Software will be available in the system itself. The availability can be measured in terms of MTTR (Mean Time to Repair) and MTBF (Mean Time Between failures). The system will be available to the user whenever the user needs it.

Maintainability:

The system should be easy to maintain by administrators. After certain of time, the system should be added new function, new features so that it can provide user good qualities.
